

Improving *Lyngbya wollei* Surveys Using non-Destructive Echosounding Measures

The background of the slide is a close-up photograph of a *Lyngbya wollei* colony. It shows a dense, textured surface with a color gradient from deep blue at the top to bright yellow and green at the bottom, indicating different depths or concentrations of the cyanobacteria.

Andrew W. Howell, J. Tyler Harris, and Dr. Robert J. Richardson
NORTH CAROLINA STATE UNIVERSITY

Lyngbya wollei

- Mat-forming, benthic cyanobacteria
- Rapid biomass development
- Difficult to manage and quantify

Single Cells

Survey Rake

Lake Gaston, NC

Objectives for Improved Survey

Three primary goals:

- 1. Provide more precise and repeatable survey option**
- 2. Monitor varying herbicide treatment effects over time**
- 3. Increase objectiveness of seasonal lyngbya abundance**

Echosounding Overview

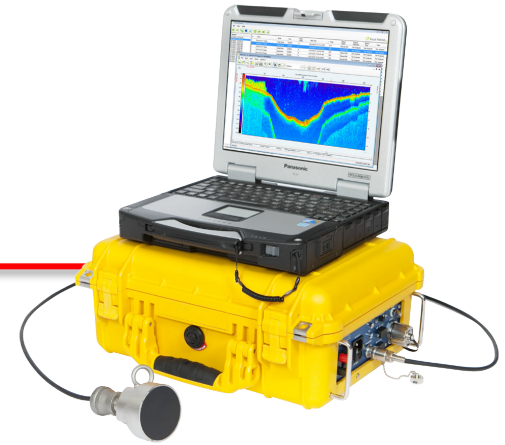

- I. Background information
- II. Autonomous survey strategy
- III. Echosounding measures
- IV. Methods and examples for quantifying biomass
- V. Management implications

BioSonics MX Aquatic Habitat Echosounder

Single frequency – 204.8 kHz

Beam angle – 8.5 degree conical

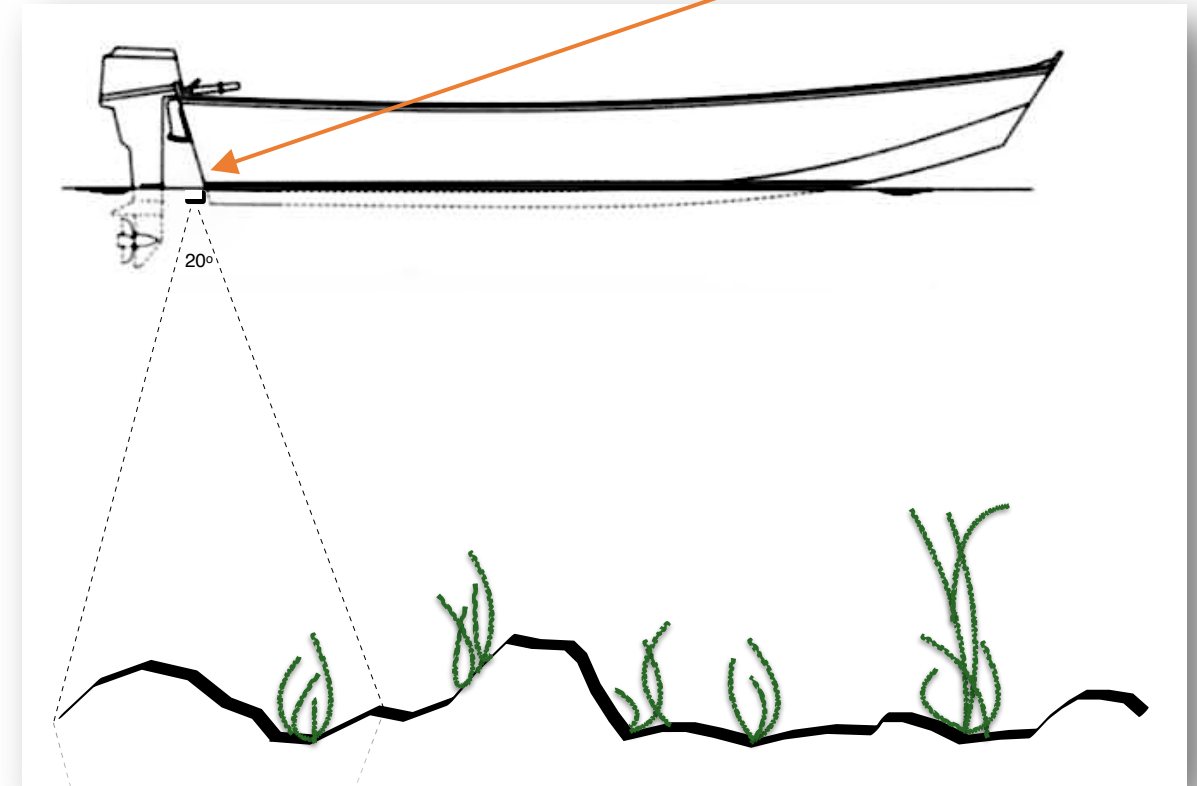

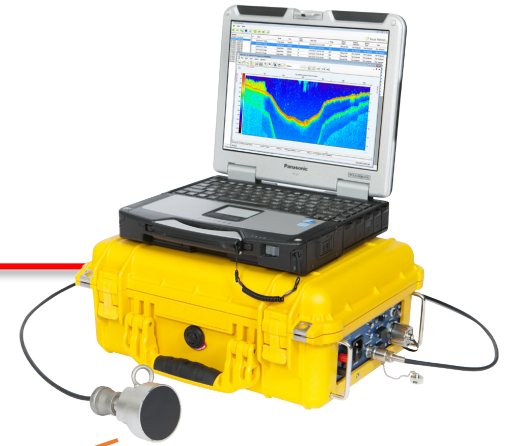

Ping rate – 5 per second

What is Echosounding?

Using SONAR (echosounding) for detecting, locating, and measuring submersed objects [vegetation].

- Active acoustic technology
- Sound travels through water, encounters different media densities and returns back to the original source

Premise for Lyngbya Management

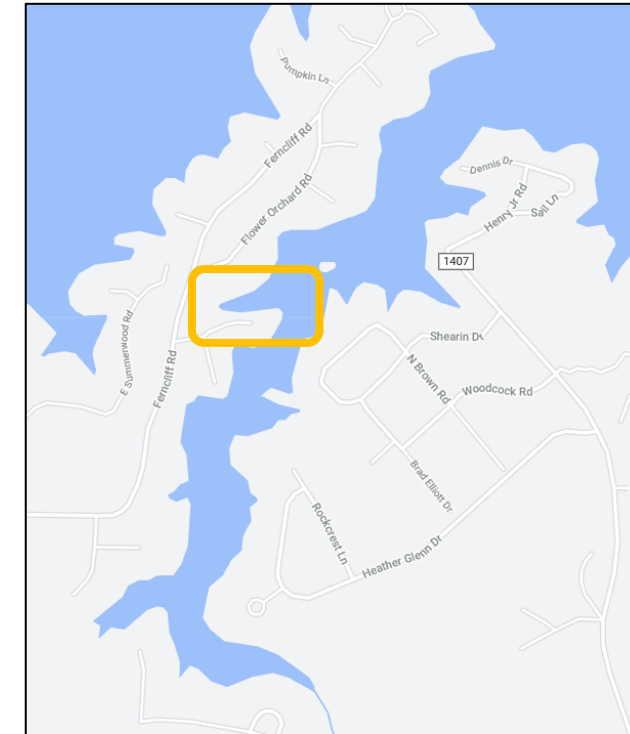

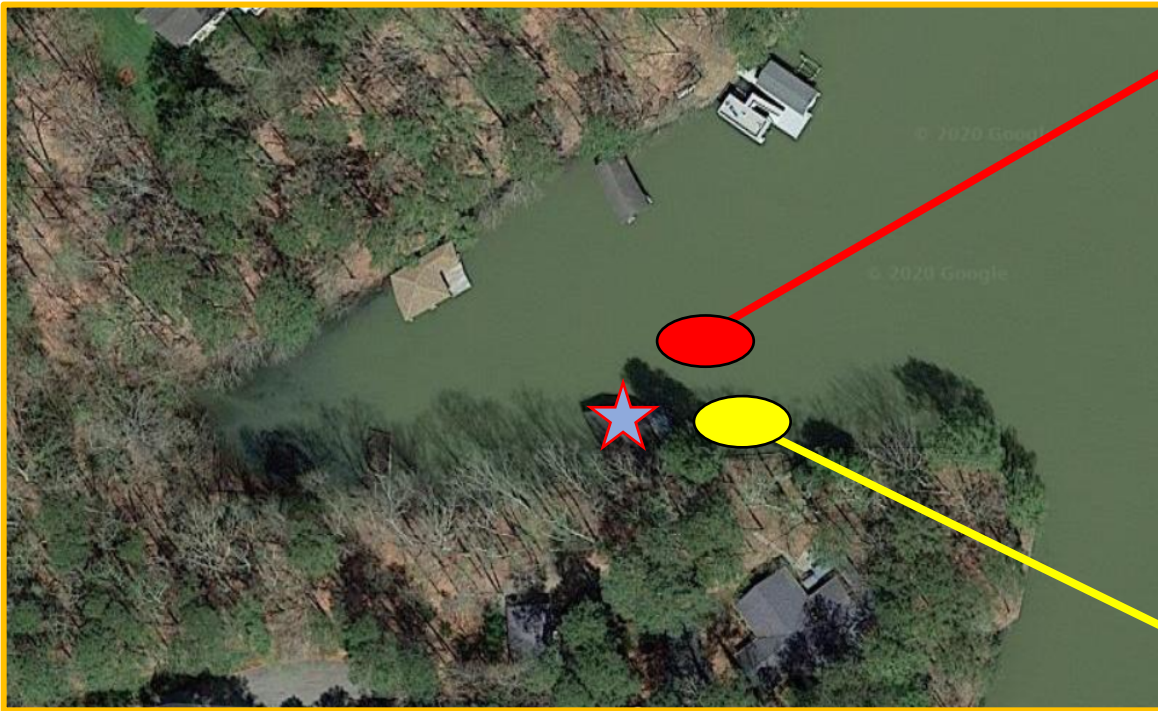

- What's the desire for echosounding?
- What are some of the goals for management?
- Current stakeholders suggest strong need for research.
- EDRR: Early Detection, Rapid Response.

Aerial Observation

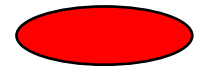

Key Advantages: Resolution, Data Processing, and Repeatable as needed.

Point-Sampling Variability

Biomass Site

Extra Rake Toss

Blue Boat House

Manned/Autonomous Survey

- 17' aluminum V-hull vessel
- *Navigation Computer*: Lowrance Carbon HDS-7
- *Auto Steer*: MotorGuide Xi5 Trolling Motor with Sonar and Pinpoint GPS (24v system)
- *Mission Planning*: Import GPX files developed from previous tracks, GIS, or develop waypoint missions in-field
- *Vessel Speed*: 4.8 km/hr

***Cautionary Note: Transect spacing is critical... the tighter, the greater variance.**

Autonomy Testing

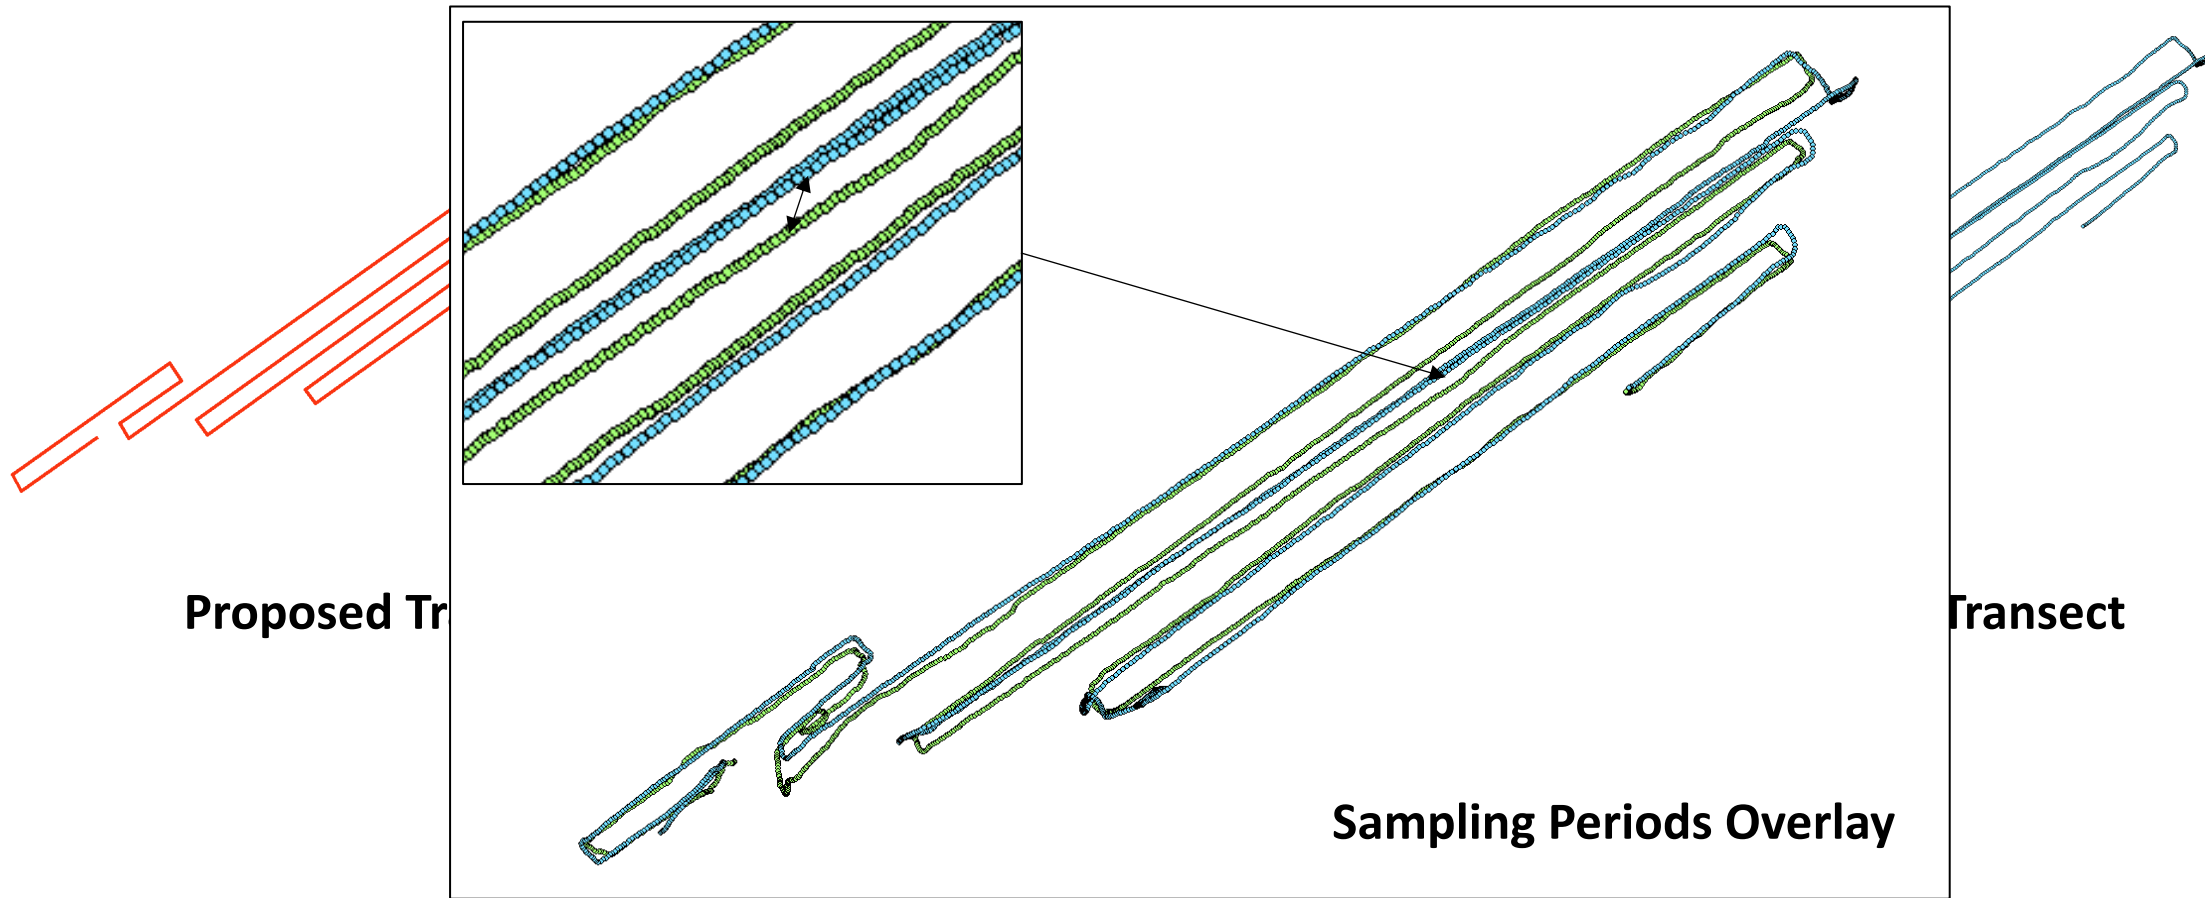

- Shearon Harris and Jordan Reservoirs
- Provide optimal transect spacing for repeated sensing applications
- Tested vertex spacing and track length

Spacings Tested: 10, 15, 20, 25, 50 meters

20 m transect spacing appropriate for our study implementation

Autonomous Survey Example

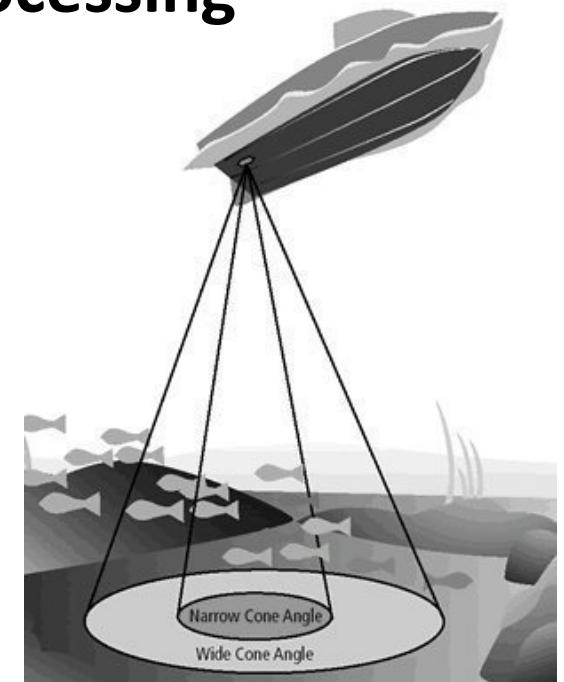

GPS variation between sampling periods: 1-7 m

Echosounding Measures

Primary Differences Among Transducers and Processing

Physical Settings	Biosonics MX Transducer	Lowrance Transducer
Transducer Frequency	204.8-kHz	200-kHz
Ping Rate s ⁻¹	5	10-15
Beam Angle*	8.5°	20°
Computer	Toughbook Laptop	Most Lowrance Units
Data Acquisition*	Visual Acquisition	Internal
Data Processing*	Visual Habitat	Cloud-based (optional)

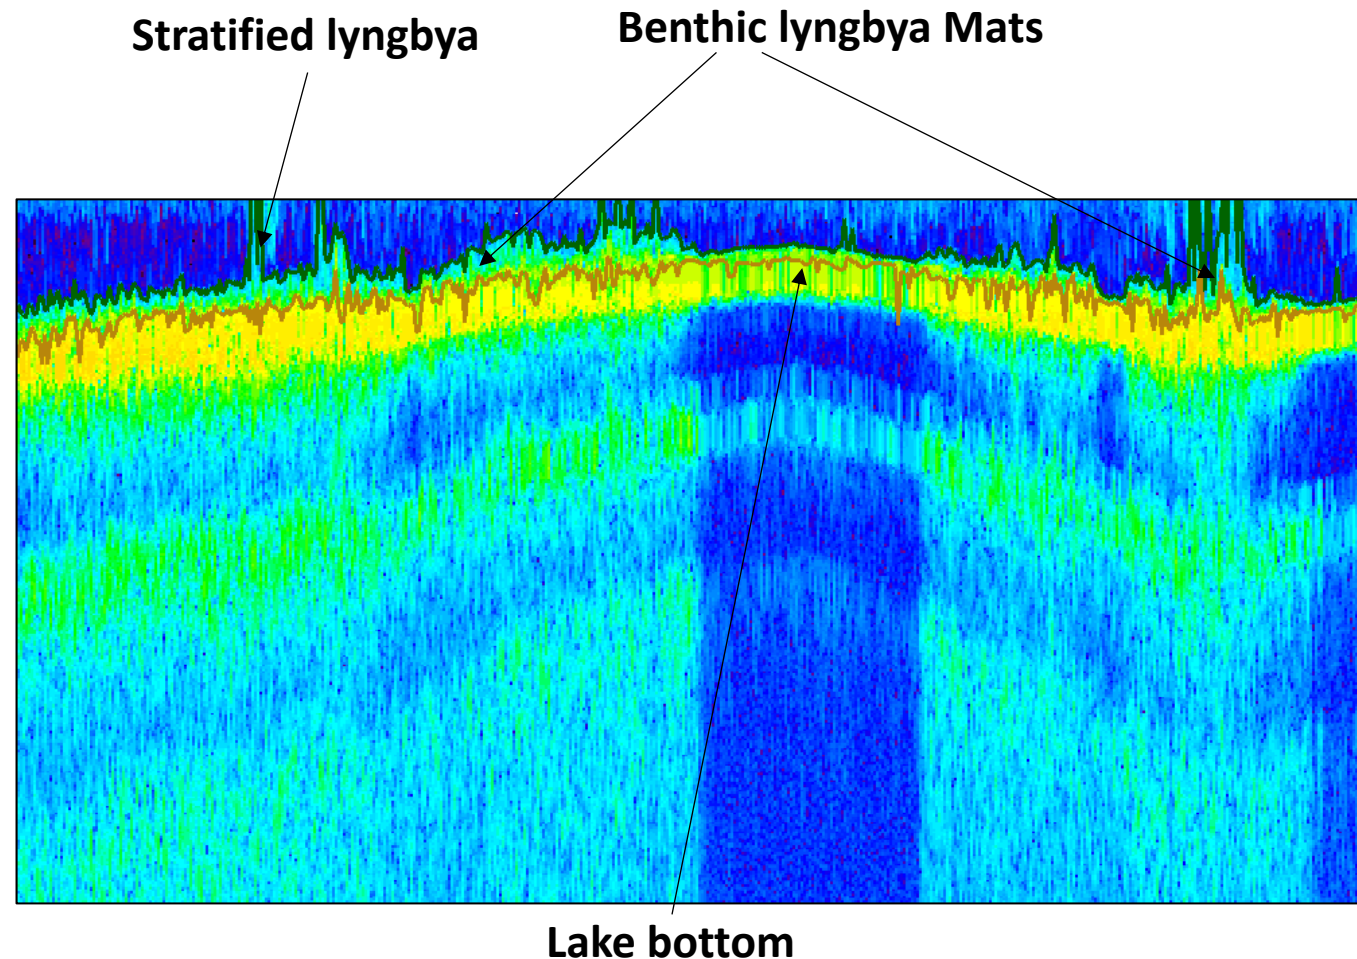

<https://www.chsmith.com.au/news/My-Beam-Angle-is-wider-than-yours.html>

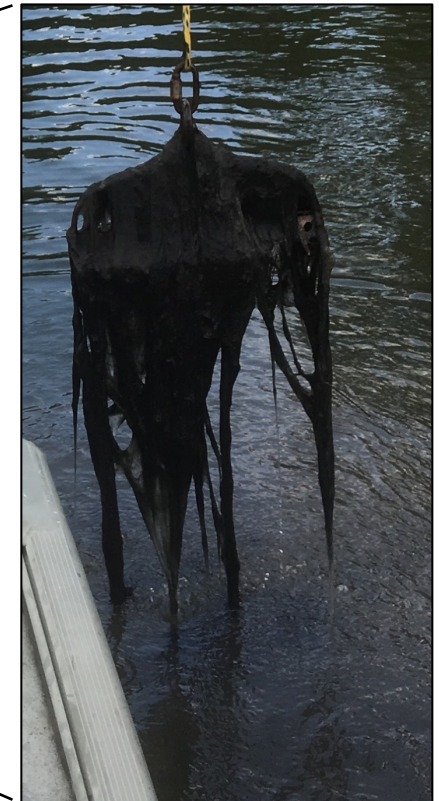

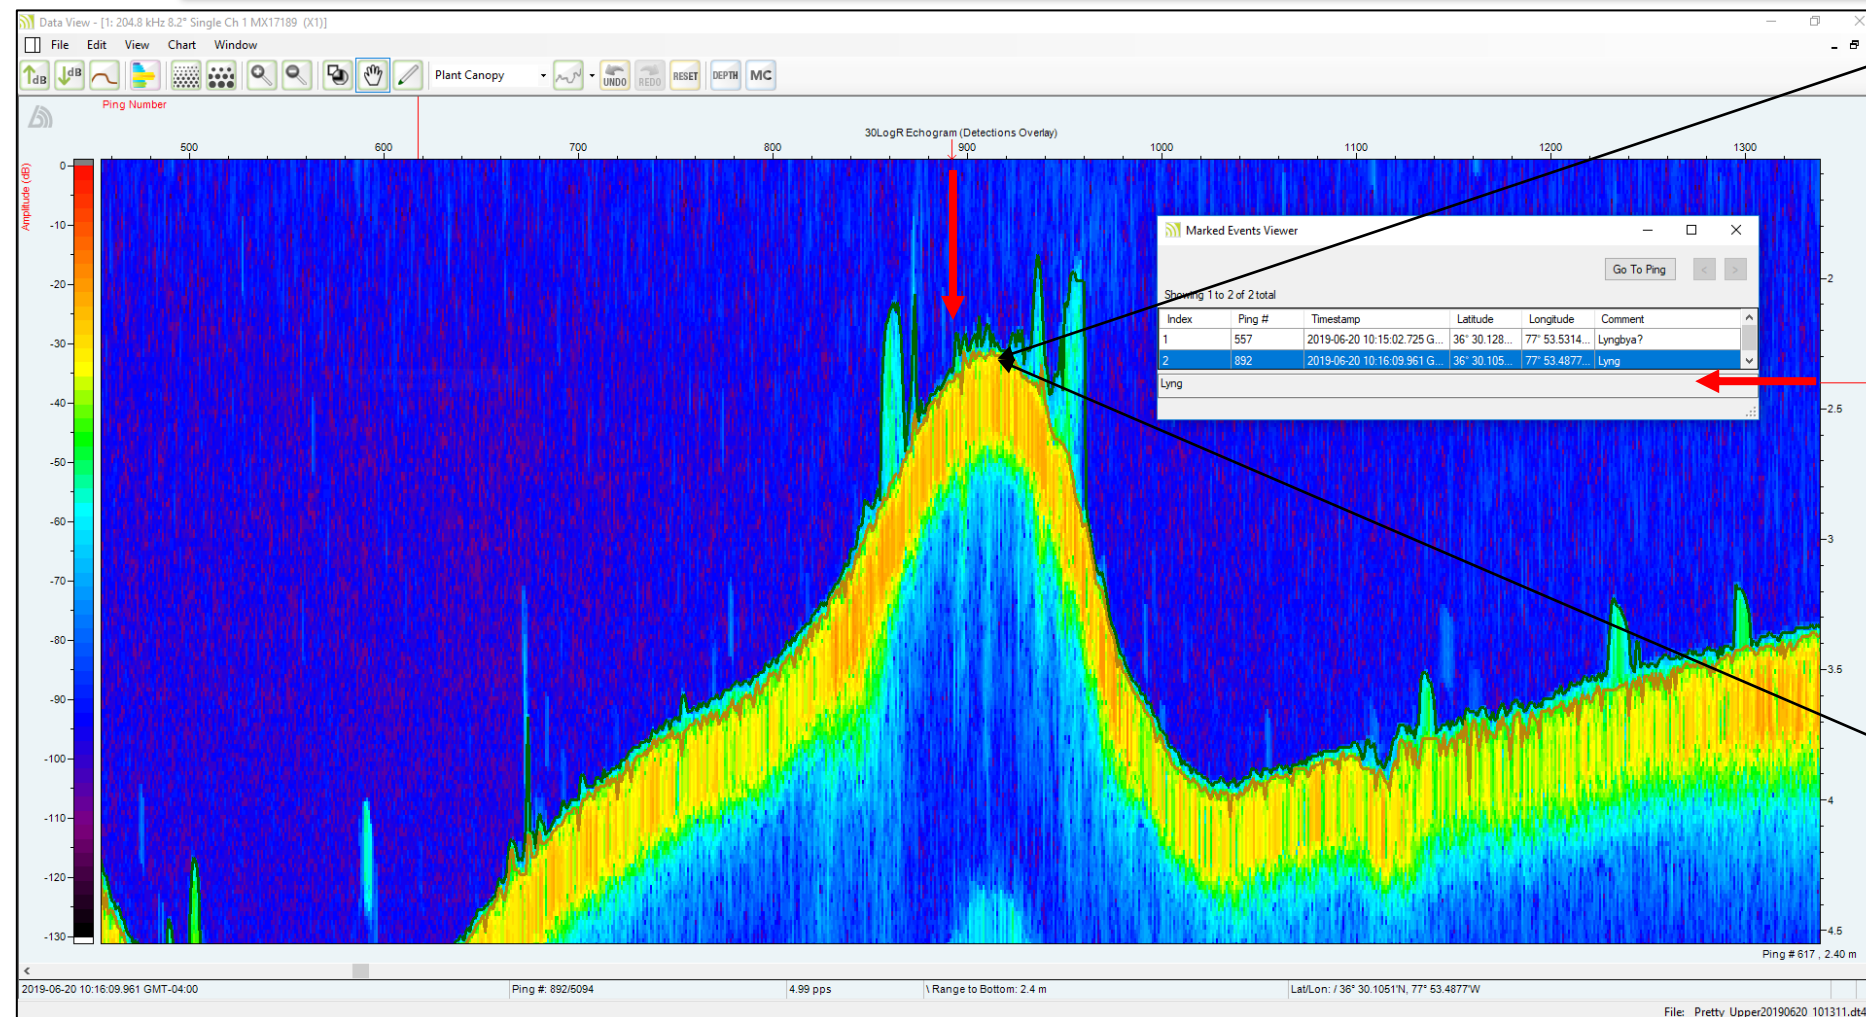

***Ability to tailor acquisition and processing settings for specific study site, environmental factors, or vegetation type.**

Echosounding Background

- Tyler Harris testing MX unit
- Shearon Harris and Lake Gaston– Summer and Fall '18
- Testing ability to map SAV using historical lakewide survey maps
- Vegetation recognition in regions previously documented to contain lyngbya
- Confirmed with rake-toss

Lyngbya Confirmation *in situ*

Notate observations at given waypoint or desired ping output.

Echosounding Methodology

Temporal Biovolume Trends

Example Findings: Means Separation

Mean lyngbya mat heights among treatment sites among BioSonics sampling timepoints.

Timepoint	Mean Mat Height
<i>April (23,24,25)</i>	0.23 a
<i>June (17,18,20)</i>	0.33 ab
<i>August (01,06,09)</i>	0.83 b
<i>August (19,21,22)</i>	0.36 ab
<i>September (23,25,26)</i>	0.22 a
<i>November (18,19,20)</i>	0.38 ab

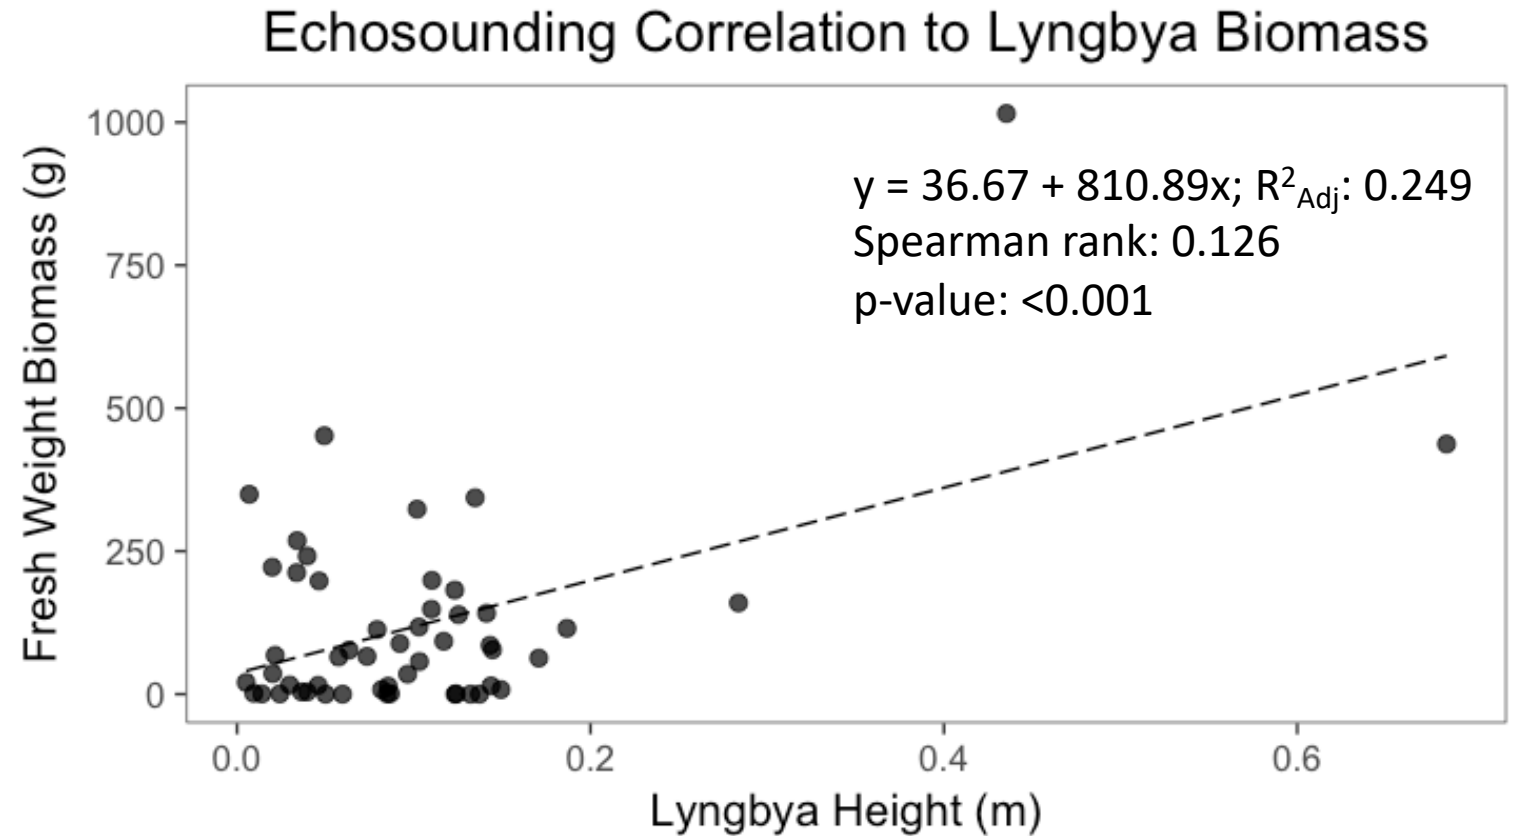

*Mat heights selected from each raster timepoint using the same coordinates as biomass sampling points (n = 4 per treatment site).

** Means within the same column followed by the same letter do not significantly differ (P < .05).

Example Findings

Raster comparisons

Correlation analyses

*Only one run of data shown with 52 observations.

2020 Preliminary Findings

2020 Lyngbya Biomass Pilot Study

Lyngbya Biomass v. Hydroacoustic Method

Biomass Collection

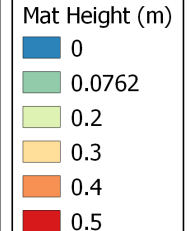

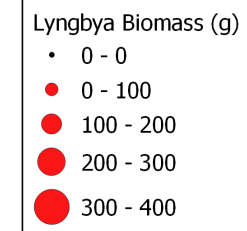

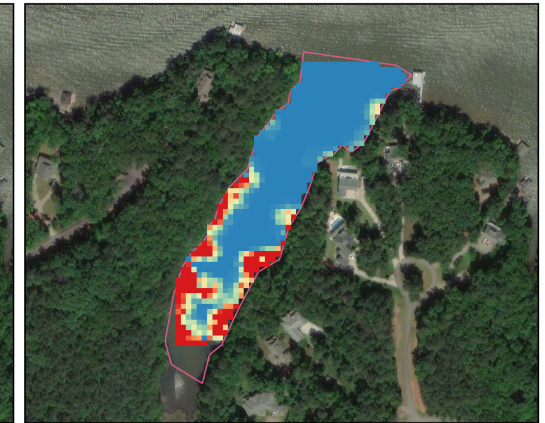

0 50 100 150 200 m

BioSonics

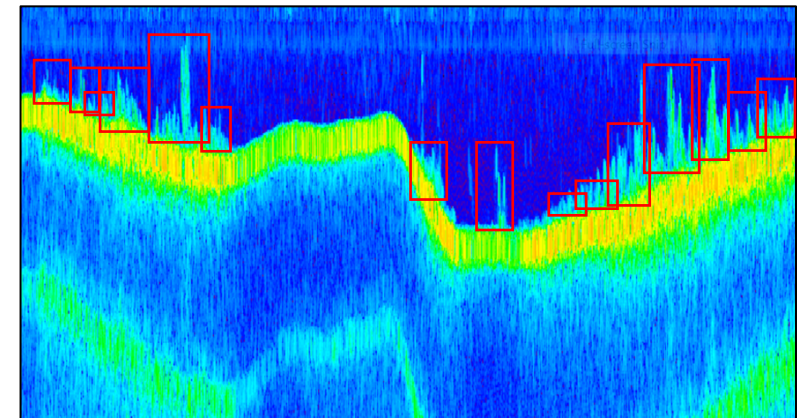

BioBase

Summary of Findings

- Transects allow repeated measures for spatial comparison pre- and post-treatment
- User-based processing provides ability to confirm lyngbya presence in-field
- Data processing allows discovery of mats which may otherwise go undetected using rake-toss and biomass methods alone
- Surface mats difficult to map using echosounding alone

Management Implications

- I. Improve current monitoring efforts to provide quantifiable measure of presence and abundance for treatments
- II. Provides savings in time and personnel effort
- III. Repeatable and objective option for many traditional surveys
- IV. Reduce risk of spread during monitoring

**EDRR: Identification of nuisance, non-native, or invasive species to decrease environmental and economic risk.*
